# Package 'cvms'

September 29, 2019

```
Title Cross-Validation for Model Selection
Version 0.3.0
Description Cross-validate one or multiple regression and classification models
      and get relevant evaluation metrics in a tidy format. Validate the
      best model on a test set and compare it to a baseline evaluation.
      Alternatively, evaluate predictions from an external model. Currently
      supports regression and classification (binary and multiclass).
      Described in chp. 5 of Jeyaraman, B. P., Olsen, L. R.,
      & Wambugu M. (2019, ISBN: 9781838550134).

Create baseline evaluations

## Description

## Maturing

Create a baseline evaluation of a test set.

When family is gaussian: fits baseline models ( $y \sim 1$ ) on n random subsets of train\_data and evalutes each model on test\_data. Also evaluates a model fitted on all rows in train\_data.

When family is binomial: evaluates n sets of random predictions against the dependent variable, along with a set of all 0 predictions and a set of all 1 predictions.

When family is multinomial: creates one-vs-all (binomial) baseline evaluations for n sets of random predictions against the dependent variable, along with sets of "all class x,y,z,..." predictions.

#### Usage

```
baseline(test_data, dependent_col, train_data = NULL, n = 100,
  family = "binomial", positive = 2, cutoff = 0.5,
  random_generator_fn = runif, random_effects = NULL,
  min_training_rows = 5, min_training_rows_left_out = 3,
  REML = FALSE, parallel = FALSE)
```

#### **Arguments**

test\_data Data Frame.

dependent\_col Name of dependent variable in the supplied test and training sets.

train\_data Data Frame. Only used when family == "gaussian".

n Number of random samplings to perform.

For gaussian: The number of random samplings of train\_data to fit baseline

models on.

For binomial and multinomial: The number of sets of random predictions to

evaluate.

family Name of family. (Character)

Currently supports "gaussian", "binomial" and "multinomial".

positive Level from dependent variable to predict. Either as character or level index (1

or 2 - alphabetically).

E.g. if we have the levels "cat" and "dog" and we want "dog" to be the positive class, we can either provide "dog" or 2, as alphabetically, "dog" comes after

"cat".

Used when calculating confusion matrix metrics and creating ROC curves.

N.B. Only affects evaluation metrics, not the returned predictions.

**N.B. Binomial only.** (Character or Integer)

cutoff Threshold for predicted classes. (Numeric)

N.B. Binomial only

random\_generator\_fn

Function for generating random numbers when type is "multinomial". The softmax function is applied to the generated numbers to transform them to probabilities.

The first argument must be the number of random numbers to generate, as no other arguments are supplied.

To test the effect of using different functions, see multiclass\_probability\_tibble.

N.B. Multinomial only

random\_effects Random effects structure for Gaussian baseline model. (Character)

E.g. with "(1|ID)", the model becomes " $y \sim 1 + (1|ID)$ ".

N.B. Gaussian only

min\_training\_rows

Minimum number of rows in the random subsets of train\_data.

Gaussian only. (Integer)

min\_training\_rows\_left\_out

Minimum number of rows left out of the random subsets of train\_data.

I.e. a subset will maximally have the size:

max\_rows\_in\_subset = nrow(train\_data) -min\_training\_rows\_left\_out.

N.B. Gaussian only. (Integer)

REML Whether to use Restricted Maximum Likelihood. (Logical)

N.B. Gaussian only. (Integer)

parallel Whether to run the n evaluations in parallel. (Logical)

Remember to register a parallel backend first. E.g. with doParallel::registerDoParallel.

#### **Details**

Packages used:

#### **Models:**

Gaussian: stats::lm

#### Results: Gaussian:

r2m:MuMIn::r.squaredGLMM r2c:MuMIn::r.squaredGLMM

AIC: stats::AIC
AICc: MuMIn::AICc
BIC: stats::BIC

#### Binomial and Multinomial:

Confusion matrix and related metrics: caret::confusionMatrix

ROC and related metrics: pROC::roc

MCC: mltools::mcc

#### Value

List containing:

- 1. a tibble with summarized results (called summarized\_metrics)
- 2. a tibble with random evaluations (random\_evaluations)
- 3. a tibble with the summarized class level results (summarized\_class\_level\_results) (**Multinomial only**)

#### **Gaussian Results:**

\_\_\_\_\_

The Summarized Results tibble contains:

Average RMSE, MAE, r2m, r2c, AIC, AICc, and BIC.

The **Measure** column indicates the statistical descriptor used on the evaluations. The row where Measure == All\_rows is the evaluation when the baseline model is trained on all rows in train\_data.

The **Training Rows** column contains the aggregated number of rows used from train\_data, when fitting the baseline models.

.....

The Random Evaluations tibble contains:

The non-aggregated metrics.

A nested tibble with the **predictions** and targets.

A nested tibble with the **coefficients** of the baseline models.

Number of training rows used when fitting the baseline model on the training set.

Specified family. Name of **dependent** variable. Name of **fixed** effect (bias term only). Random effects structure (if specified). **Binomial Results:** Based on the generated test set predictions, a confusion matrix and ROC curve are used to get the following: ROC: AUC, Lower CI, and Upper CI Confusion Matrix: Balanced Accuracy, F1, Sensitivity, Specificity, Positive Prediction Value, Negative Prediction Value, Kappa, Detection Rate, Detection Prevalence, Prevalence, and MCC (Matthews correlation coefficient). The **Summarized Results** tibble contains: The Measure column indicates the statistical descriptor used on the evaluations. The row where Measure == All\_0 is the evaluation when all predictions are 0. The row where Measure == All\_1 is the evaluation when all predictions are 1. The aggregated metrics. The **Random Evaluations** tibble contains: The non-aggregated metrics. A nested tibble with the **predictions** and targets. A nested tibble with the sensativities and specificities from the **ROC** curve. A nested tibble with the **confusion matrix**. The Pos\_ columns tells you whether a row is a True Positive (TP), True Negative (TN), False Positive (FP), or False Negative (FN), depending on which level is the "positive" class. I.e. the level you wish to predict. Specified family.

Name of **dependent** variable.

#### **Multinomial Results:**

Based on the generated test set predictions, one-vs-all (binomial) evaluations are performed and aggregated to get the same metrics as in the binomial results, with the addition of **Overall Accuracy** in the summarized results.

.....

#### The **Summarized Results** tibble contains:

Summary of the random evaluations.

**How**: First, the one-vs-all binomial evaluations are aggregated by repetition (ignoring NAs), and then, these aggregations are summarized. Besides the metrics from the binomial evaluations (see *Binomial Results* above), it also includes the **Overall Accuracy** metric.

The Measure column indicates the statistical descriptor used on the evaluations. The Mean, Median, SD, and IQR describe the repetition evaluations (similar to the Random Evaluations

tibble, but ignoring NAs when aggregating, as the NAs and INFs are counted instead), while the **Max**, **Min**, **NAs**, and **INFs** are extracted from the *Summarized Class Level Results* tibble, to get the overall values. The NAs and INFs are only counted in the one-vs-all evaluations.

The rows where Measure == All\_<<class name>> are the evaluations when all the observations are predicted to be in that class.

.....

## The Summarized Class Level Results tibble contains:

The (nested) summarized results for each class, with the same metrics and descriptors as the *Summarized Results* tibble. Use tidyr::unnest on the tibble to inspect the results.

**How**: The one-vs-all evaluations are summarized by class.

The rows where Measure == All\_0 are the evaluations when none of the observations are predicted to be in that class, while the rows where Measure == All\_1 are the evaluations when all of the observations are predicted to be in that class.

.....

#### The **Random Evaluation** tibble contains:

The repetition results with the same metrics as the Summarized Results tibble.

**How**: The one-vs-all evaluations are aggregated by repetition. NA's are not ignored, meaning that any NA from a one-vs-all evaluation will lead to an NA result for that repetition.

Also includes:

A nested tibble with the one-vs-all binomial evaluations (**Class Level Results**), including nested **ROC** curves and **Confusion Matrices**, and the **Support** column, which is a count of how many observations from the class is in the test set.

A nested tibble with the **predictions** and targets.

A nested tibble with the multiclass confusion matrix.

Specified family.

Name of **dependent** variable.

#### **Examples**

```
# Attach packages
library(cvms)
library(groupdata2) # partition()
library(dplyr) # %>% arrange()
library(tibble)

# Data is part of cvms
data <- participant.scores

# Set seed for reproducibility
set.seed(1)

# Partition data
partitions <- partition(data, p = 0.7, list_out = TRUE)
train_set <- partitions[[1]]
test_set <- partitions[[2]]

# Create baseline evaluations</pre>
```

```
# Note: usually n=100 is a good setting
# Gaussian
baseline(test_data = test_set, train_data = train_set,
         dependent_col = "score", random_effects = "(1|session)",
         n = 2, family = "gaussian")
# Binomial
baseline(test_data = test_set, dependent_col = "diagnosis",
         n = 2, family = "binomial")
# Multinomial
# Create some data with multiple classes
multiclass_data <- tibble(</pre>
    "target" = rep(paste0("class_", 1:5), each = 10)) %>%
    dplyr::sample_n(35)
baseline(test_data = multiclass_data,
         dependent_col = "target",
         n = 4, family = "multinomial")
# Parallelize evaluations
# Attach doParallel and register four cores
# Uncomment:
# library(doParallel)
# registerDoParallel(4)
baseline(test_data = test_set, dependent_col = "diagnosis",
         n = 4, family = "binomial", parallel = TRUE)
# Gaussian
baseline(test_data = test_set, train_data = train_set,
         dependent_col = "score", random_effects = "(1|session)",
         n = 4, family = "gaussian", parallel = TRUE)
# Multinomial
(mb <- baseline(test_data = multiclass_data,</pre>
               dependent_col = "target",
               n = 4, family = "multinomial",
               parallel = TRUE))
# Inspect the summarized class level results
# for class_2
mb$summarized_class_level_results %>%
 dplyr::filter(Class == "class_2") %>%
tidyr::unnest(Results)
# Multinomial with custom random generator function
# that creates very "certain" predictions
# (once softmax is applied)
rcertain <- function(n){</pre>
    (runif(n, min = 1, max = 100)^1.4)/100
}
```

8 combine\_predictors

combine\_predictors

Generate model formulas by combining predictors

#### **Description**

#### **Maturing**

Create model formulas with every combination of your fixed effects, along with the dependent variable and random effects. 259,358 formulas have been precomputed with two- and three-way interactions for up to 8 fixed effects, with up to 5 included effects per formula. Uses the + and \* operators, so lower order interactions are automatically included.

## Usage

```
combine_predictors(dependent, fixed_effects, random_effects = NULL,
   max_fixed_effects = 5, max_interaction_size = 3,
   max_effect_frequency = NULL)
```

## **Arguments**

dependent Name of dependent variable. (Character)

fixed\_effects List of fixed effects. (Character)

Max. limit of 8 effects when interactions are included!

A fixed effect name cannot contain: white spaces, "\*" or "+".

Effects in sublists will be interchanged. This can be useful, when we have multiple versions of a predictor (e.g. x1 and log(x1)) that we do not wish to have

in the same formula.

Example of interchangeable effects:

list(list("x1","log\_x1"),"x2","x3")

random\_effects The random effects structure. (Character)

Is appended to the model formulas.

max\_fixed\_effects

Maximum number of fixed effects in a model formula. (Integer)

Max. limit of 5 when interactions are included!

max\_interaction\_size

Maximum number of effects in an interaction. (Integer)

Max. limit of 3.

Use this to limit the n-way interactions allowed.  $\emptyset$  or 1 excludes interactions all together.

A model formula can contain multiple interactions.

max\_effect\_frequency

Maximum number of times an effect is included in a formula string.

#### Value

```
List of model formulas.
```

```
E.g.: c("y \sim x1 + (1|z)", "y \sim x2 + (1|z)", "y \sim x1 + x2 + (1|z)", "y \sim x1 * x2 + (1|z)").
```

### Author(s)

Ludvig Renbo Olsen, <r-pkgs@ludvigolsen.dk>

## **Examples**

```
compatible.formula.terms
```

Compatible formula terms

## **Description**

162,660 pairs of compatible terms for building model formulas with up to 15 fixed effects.

#### **Format**

A data frame with 162,660 rows and 5 variables:

```
left term, fixed effect or interaction, with fixed effects separated by "*"
right term, fixed effect or interaction, with fixed effects separated by "*"
max_interaction_size maximum interaction size in the two terms, up to 3
num_effects number of unique fixed effects in the two terms, up to 5
min_num_fixed_effects minimum number of fixed effects required to use a formula with the two terms, i.e. the index in the alphabet of the last of the alphabetically ordered effects (letters) in the two terms, so 4 if left == "A" and right == "D"
```

#### **Details**

A term is either a fixed effect or an interaction between fixed effects (up to three-way), where the effects are separated by the "\*" operator.

Two terms are compatible if they are not redundant, meaning that both add a fixed effect to the formula. E.g. as the interaction "x1 \* x2 \* x3" expands to "x1 + x2 + x3 + x1 \* x2 + x1 \* x3 + x2 \* x3 + x1 \* x2 \* x3", the higher order interaction makes these "sub terms" redundant. Note: All terms are compatible with NA.

Effects are represented by the first fifteen capital letters.

Used to generate the model formulas for combine\_predictors.

#### Author(s)

Ludvig Renbo Olsen, <r-pkgs@ludvigolsen.dk>

cross\_validate

Cross-validate regression models for model selection

#### **Description**

#### Stable

Cross-validate one or multiple gaussian or binomial models at once. Perform repeated cross-validation. Returns results in a tibble for easy comparison, reporting and further analysis.

See cross\_validate\_fn() for use with custom model functions.

#### Usage

```
cross_validate(data, models, fold_cols = ".folds", family = "gaussian",
  link = NULL, control = NULL, REML = FALSE, cutoff = 0.5,
  positive = 2, metrics = list(), rm_nc = FALSE, parallel = FALSE,
  model_verbose = FALSE)
```

See stats::family for available link functions.

## Arguments

data Data frame. Must include grouping factor for identifying folds - as made with groupdata2::fold(). models Model formulas as strings. (Character) E.g. c("y~x","y~z"). Can contain random effects. E.g.  $c("y\sim x+(1|r)", "y\sim z+(1|r)")$ . fold\_cols Name(s) of grouping factor(s) for identifying folds. (Character) Include names of multiple grouping factors for repeated cross-validation. family Name of family. (Character) Currently supports "gaussian" and "binomial". link Link function. (Character) E.g. link = "log" with family = "gaussian" will use family = gaussian(link

#### **Default link functions:**

Gaussian: 'identity'. Binomial: 'logit'.

control Construct control structures for mixed model fitting (i.e. lmer and glmer). See

lme4::lmerControl and lme4::glmerControl.

N.B. Ignored if fitting lm or glm models.

REML Restricted Maximum Likelihood. (Logical)
cutoff Threshold for predicted classes. (Numeric)

N.B. Binomial models only

positive Level from dependent variable to predict. Either as character or level index (1

or 2 - alphabetically).

E.g. if we have the levels "cat" and "dog" and we want "dog" to be the positive class, we can either provide "dog" or 2, as alphabetically, "dog" comes after

"cat".

Used when calculating confusion matrix metrics and creating ROC curves.

N.B. Only affects evaluation metrics, not the model training or returned predic-

tions.

N.B. Binomial models only.

metrics List for enabling/disabling metrics.

E.g. list("RMSE" = FALSE) would remove RMSE from the results, and list("Accuracy"

= TRUE) would add the regular accuracy metric to the classification results. Default values (TRUE/FALSE) will be used for the remaining metrics available.

Also accepts the string "all".

N.B. Currently, disabled metrics are still computed.

rm\_nc Remove non-converged models from output. (Logical)

parallel Whether to cross-validate the list of models in parallel. (Logical)

 $Remember \ to \ register \ a \ parallel \ backend \ first. \ E.g. \ with \ doParallel::registerDoParallel.$ 

model\_verbose Message name of used model function on each iteration. (Logical)

#### **Details**

Packages used:

#### Models:

Gaussian: stats::lm, lme4::lmer
Binomial: stats::glm, lme4::glmer

## **Results:**

#### Gaussian:

r2m: MuMIn::r.squaredGLMM
r2c: MuMIn::r.squaredGLMM

AIC: stats::AIC AICc: MuMIn::AICc BIC: stats::BIC

Binomial:

Confusion matrix: caret::confusionMatrix

ROC: pROC::roc
MCC: mltools::mcc

#### Value

Tbl (tibble) with results for each model.

**Shared across families:** A nested tibble with **coefficients** of the models from all iterations.

Number of total folds.

Number of **fold columns**.

Count of **convergence warnings**. Consider discarding models that did not converge on all iterations. Note: you might still see results, but these should be taken with a grain of salt!

Count of other warnings. These are warnings without keywords such as "convergence".

Count of Singular Fit messages. See ?lme4::isSingular for more information.

Nested tibble with the warnings and messages caught for each model.

Specified family.

Specified link function.

Name of dependent variable.

Names of **fixed** effects.

Names of **random** effects, if any.

## Gaussian Results:

Average RMSE, MAE, r2m, r2c, AIC, AICc, and BIC of all the iterations\*, omitting potential NAs from non-converged iterations. Note that the Information Criteria metrics (AIC, AICc, and BIC) are also averages.

A nested tibble with the **predictions** and targets.

A nested tibble with the non-averaged **results** from all iterations.

\* In *repeated cross-validation*, the metrics are first averaged for each fold column (repetition) and then averaged again.

#### **Binomial Results:**

Based on the **collected** predictions from the test folds\*, a confusion matrix and a ROC curve are created to get the following:

ROC:

AUC, Lower CI, and Upper CI

Confusion Matrix:

Balanced Accuracy, F1, Sensitivity, Specificity, Positive Prediction Value, Negative Prediction Value, Kappa, Detection Rate, Detection Prevalence, Prevalence, and MCC (Matthews correlation coefficient).

Other available metrics (disabled by default, see metrics): Accuracy.

Also includes:

A nested tibble with **predictions**, predicted classes (depends on cutoff), and the targets. Note, that the **predictions are not necessarily of the specified** positive **class**, but of the model's positive class (second level of dependent variable, alphabetically).

A nested tibble with the sensativities and specificities from the **ROC** curve(s).

A nested tibble with the **confusion matrix**/matrices. The Pos\_ columns tells you whether a row is a True Positive (TP), True Negative (TN), False Positive (FP), or False Negative (FN), depending on which level is the "positive" class. I.e. the level you wish to predict.

A nested tibble with the **results** from all fold columns, when using *repeated cross-validation*.

\* In repeated cross-validation, an evaluation is made per fold column (repetition) and averaged.

            "score~age+(1|session)")
cross_validate(data,
               models = models,
               family = 'gaussian',
               REML = FALSE)
# Use non-default link functions
```

```
cross_validate(data,
               models = "score~diagnosis",
               family = 'gaussian',
               link = 'log',
               REML = FALSE)
# Use parallelization
# Attach doParallel and register four cores
# Uncomment:
# library(doParallel)
# registerDoParallel(4)
# Create list of 20 model formulas
models <- rep(c("score~diagnosis+(1|session)",</pre>
                "score~age+(1|session)"), 10)
# Cross-validate a list of 20 model formulas in parallel
system.time({cross_validate(data,
                            models = models,
                            family = 'gaussian',
                            parallel = TRUE)})
# Cross-validate a list of 20 model formulas sequentially
system.time({cross_validate(data,
                            models = models,
                            family = 'gaussian',
                            parallel = FALSE)})
```

cross\_validate\_fn

Cross-validate custom model functions for model selection

## **Description**

## **Experimental**

Cross-validate your model function with one or multiple model formulas at once. Perform repeated cross-validation. Returns results in a tibble for easy comparison, reporting and further analysis.

Compared to cross\_validate(), this function allows you supply a custom model function and (if needed) a custom prediction function.

Supports regression and classification (binary and multiclass). See type.

Note that some metrics may not be computable for all types of model objects.

#### Usage

```
cross_validate_fn(data, model_fn, formulas, fold_cols = ".folds",
  type = "gaussian", cutoff = 0.5, positive = 2,
  predict_type = NULL, predict_fn = NULL, metrics = list(),
  rm_nc = FALSE, parallel = FALSE)
```

#### **Arguments**

data Data frame.

 $Must include grouping factor for identifying folds-as made with {\tt groupdata2::fold()}.$ 

model\_fn Model function that returns a fitted model object. Will usually wrap an existing

model function like e1071::svm or nnet::multinom.

Must have the following function arguments:

function(train\_data, formula)

formulas Model formulas as strings. (Character)

Will be converted to formula objects before being passed to model\_fn.

E.g. c("y~x","y~z").

Can contain random effects.

E.g.  $c("y\sim x+(1|r)", "y\sim z+(1|r)")$ .

fold\_cols Name(s) of grouping factor(s) for identifying folds. (Character)

Include names of multiple grouping factors for repeated cross-validation.

type Type of evaluation to perform:

"gaussian" for regression (like linear regression).

"binomial" for binary classification.

"multinomial" for multiclass classification.

cutoff Threshold for predicted classes. (Numeric)

N.B. Binomial models only

positive Level from dependent variable to predict. Either as character or level index (1

or 2 - alphabetically).

E.g. if we have the levels "cat" and "dog" and we want "dog" to be the positive class, we can either provide "dog" or 2, as alphabetically, "dog" comes after "cat".

Used when calculating confusion matrix metrics and creating ROC curves.

N.B. Only affects evaluation metrics, not the model training or returned predictions.

N.B. Binomial models only.

predict\_type The type argument for predict().

When the defaults fail, provide it such that the predict() output is as follows:

**Binomial:** Vector or one-column matrix / data frame with probabilies (0-1). E.g.:

c(0.3,0.5,0.1,0.5)

**Gaussian:** Vector or one-column matrix / data frame with the predicted value.

c(3.7,0.9,1.2,7.3)

**Multinomial:** Data frame with one column per class containing probabilities of the class. Column names should be identical to how the class names are written in the target column. E.g.:

class_1	class_2	class_3
0.269	0.528	0.203
0.368	0.322	0.310
0.375	0.371	0.254

N.B. predict\_fn and predict\_type are mutually exclusive. Specify only one of them.

predict\_fn Function for predicting the targets in the test folds using the fitted model object.

Will usually wrap predict(), but doesn't have to. Must return predictions in

the format described in predict\_type above. Must have the following function arguments:

function(test\_data,model,formula = NULL)

N.B. predict\_fn and predict\_type are mutually exclusive. Specify only one

of them.

metrics List for enabling/disabling metrics.

E.g. list("RMSE" = FALSE) would remove RMSE from the results, and list("Accuracy"

= TRUE) would add the regular accuracy metric to the classification results. Default values (TRUE/FALSE) will be used for the remaining metrics available.

Also accepts the string "all".

N.B. Currently, disabled metrics are still computed.

rm\_nc Remove non-converged models from output. (Logical)

parallel Whether to cross-validate the list of models in parallel. (Logical)

Remember to register a parallel backend first. E.g. with doParallel::registerDoParallel.

#### **Details**

Packages used:

#### **Results:**

Gaussian:

 $\begin{array}{l} r2m: \texttt{MuMIn::r.squaredGLMM} \\ r2c: \texttt{MuMIn::r.squaredGLMM} \end{array}$ 

AIC: stats::AIC AICc: MuMIn::AICc BIC: stats::BIC

Binomial:

Confusion matrix: caret::confusionMatrix

ROC: pROC: roc
MCC: mltools: :mcc

## Value

Tbl (tibble) with results for each model.

**Shared across families:** A nested tibble with **coefficients** of the models from all iterations. The coefficients are extracted from the model object with <code>broom::tidy()</code> or <code>coef()</code> (with some restrictions on the output). If these attempts fail, a default coefficients tibble filled with NAs is returned.

Number of total folds.

Number of **fold columns**.

Count of **convergence warnings**, using a limited set of keywords (e.g. "convergence"). If a convergence warning does not contain one of these keywords, it will be counted in **other warnings** along with other warnings. Consider discarding models that did not converge on all iterations. Note: you might still see results, but these should be taken with a grain of salt!

Nested tibble with the warnings and messages caught for each model.

Specified family.

Name of **dependent** variable.

Names of **fixed** effects.

Names of **random** effects, if any.

Gaussian Results:

Average RMSE, MAE, r2m, r2c, AIC, AICc, and BIC of all the iterations\*, omitting potential NAs from non-converged iterations. Some metrics will return NA if they can't be extracted from the passed model objects.

N.B. The Information Criteria metrics (AIC, AICc, and BIC) are also averages.

A nested tibble with the **predictions** and targets.

A nested tibble with the non-averaged **results** from all iterations.

\* In *repeated cross-validation*, the metrics are first averaged for each fold column (repetition) and then averaged again.

\_\_\_\_\_

#### **Binomial Results:**

Based on the **collected** predictions from the test folds\*, a confusion matrix and a ROC curve are created to get the following:

ROC:

AUC, Lower CI, and Upper CI

Confusion Matrix:

Balanced Accuracy, F1, Sensitivity, Specificity, Positive Prediction Value, Negative Prediction Value, Kappa, Detection Rate, Detection Prevalence, Prevalence, and MCC (Matthews correlation coefficient).

Other available metrics (disabled by default, see metrics): Accuracy.

Also includes:

A nested tibble with the **predictions**, predicted classes (depends on cutoff), and targets. Note, that the **predictions are not necessarily of the specified** positive **class**, but of the model's positive class (second level of dependent variable, alphabetically).

A nested tibble with the sensativities and specificities from the **ROC** curves.

A nested tibble with the **confusion matrix**/matrices. The Pos\_columns tells you whether a row is a True Positive (TP), True Negative (TN), False Positive (FP), or False Negative (FN), depending on which level is the "positive" class. I.e. the level you wish to predict.

A nested tibble with the **results** from all fold columns, when using *repeated cross-validation*.

\* In repeated cross-validation, an evaluation is made per fold column (repetition) and averaged.

Multinomial Results:

For each class, a *one-vs-all* binomial evaluation is performed. This creates a **class level results** tibble containing the same metrics as the binomial results described above, along with the **Support** metric, which is simply a count of the class in the target column. These metrics are used to calculate the macro metrics in the output tibble. The nested class level results tibble is also

included in the output tibble, and would usually be reported along with the macro and overall metrics.

The output tibble contains the macro and overall metrics. The metrics that share their name with the metrics in the nested class level results tibble are averages of those metrics (note: does not remove NAs before averaging). In addition to these, it also includes the **Overall Accuracy** metric.

Other available metrics (disabled by default, see metrics): Accuracy, Weighted Balanced Accuracy, Weighted Accuracy, Weighted F1, Weighted Sensitivity, Weighted Sensitivity, Weighted Pos Pred Value, Weighted Neg Pred Value, Weighted AUC, Weighted Lower CI, Weighted Upper CI, Weighted Kappa, Weighted MCC, Weighted Detection Rate, Weighted Detection Prevalence, and Weighted Prevalence.

Note that the "Weighted" metrics are weighted averages, weighted by the Support.

Also includes:

A nested tibble with the **predictions**, predicted classes, and targets.

A nested tibble with the multiclass Confusion Matrix.

#### **Class Level Results**

The nested class level results tibble also includes:

A nested tibble with the sensativities and specificities from the **ROC** curve.

A nested tibble with the **confusion matrix** from the one-vs-all evaluation. The Pos\_ columns tells you whether a row is a True Positive (TP), True Negative (TN), False Positive (FP), or False Negative (FN), depending on which level is the "positive" class. In our case, 1 is the current class and 0 represents all the other classes together.

```

cv\_plot 21

## **Description**

Perform (repeated) cross-validation on a list of model formulas. Validate the best model on a validation set. Perform baseline evaluations on your test set. Generate model formulas by combining your fixed effects. Evaluate predictions from an external model.

## **Details**

Returns results in a tibble for easy comparison, reporting and further analysis.

The cvms package provides 5 main functions: cross\_validate, cross\_validate\_fn, validate, baseline, and evaluate.

And a couple of helper functions:  $combine\_predictors$ ,  $select\_metrics$ ,  $reconstruct\_formulas$ ,  $cv\_plot$ .

## Author(s)

Ludvig Renbo Olsen, <r-pkgs@ludvigolsen.dk>

cv\_plot

Wrapper for plotting common plots using ggplot2

## **Description**

#### **Experimental**

Creates various plots based on the output of cvms::cross\_validate()

## Usage

```
cv_plot(x, type)
```

## **Arguments**

x Object returned by cvms::cross\_validate() (tbl)

type Type of plot.

## Gaussian:

'RMSE' - boxplot 'r2' - boxplot 'IC' - boxplot

'coefficients' - boxplot

## Binomial:

"ROC" - ROC curve

## Author(s)

Ludvig Renbo Olsen, <r-pkgs@ludvigolsen.dk>

#### **Examples**

```
# Attach packages
library(cvms)
library(groupdata2) # fold()
# Load data (included in cvms)
data <- participant.scores</pre>
# Fold data
data <- fold(data, k = 4,
             cat_col = 'diagnosis',
             id_col = 'participant')
# Cross-validate a gaussian model
CVgauss <- cross_validate(data,</pre>
                           "score~diagnosis",
                           family='gaussian')
# Plot results for gaussian model
cv_plot(CVgauss, type = 'RMSE')
cv_plot(CVgauss, type = 'r2')
cv_plot(CVgauss, type = 'IC')
cv_plot(CVgauss, type = 'coefficients')
# Cross-validate a binomial model
CVbinom <- cross_validate(data,</pre>
                           "diagnosis~score",
                           family='binomial')
# Plot results for binomial model
cv_plot(CVbinom, type = 'ROC')
```

evaluate

Evaluate your model's performance

#### **Description**

#### **Maturing**

Evaluate your model's predictions on a set of evaluation metrics.

Create ID-aggregated evaluations by multiple methods.

Currently supports regression and classification (binary and multiclass). See type.

#### Usage

```
evaluate(data, target_col, prediction_cols, type = "gaussian",
  id_col = NULL, id_method = "mean", models = NULL,
  apply_softmax = TRUE, cutoff = 0.5, positive = 2,
  metrics = list(), include_predictions = TRUE, parallel = FALSE)
```

## Arguments

data

Data frame with predictions, targets and (optionally) an ID column. Can be grouped with group\_by.

**Multinomial:** When type is "multinomial", the predictions should be passed as one column per class with the probability of that class. The columns should have the name of their class, as they are named in the target column. E.g.:

target	class_3	class_2	class_1
class_2	0.203	0.528	0.269
class_3	0.310	0.322	0.368
class_2	0.254	0.371	0.375

**Binomial:** When type is "binomial", the predictions should be passed as one column with the probability of class being the second class alphabetically (1 if classes are 0 and 1). E.g.:

prediction	target
0.769	1
0.368	1
0.375	0

**Gaussian:** When type is "gaussian", the predictions should be passed as one column with the predicted values. E.g.:

prediction	target
28.9	30.2
33.2	27.1
23.4	21.3

target\_col Name of the column with the true classes/values in data.

When type is "multinomial", this column should contain the class names, not their indices.

prediction\_cols

Name(s) of column(s) with the predictions.

When evaluating a classification task, the column(s) should contain the predicted probabilities.

type Type of evaluation to perform:

"gaussian" for regression (like linear regression).

"binomial" for binary classification.

"multinomial" for multiclass classification.

id\_col Name of ID column to aggregate predictions by.

N.B. Current methods assume that the target class/value is constant within the IDs.

N.B. When aggregating by ID, some metrics (such as those from model objects) are excluded.

id\_method Method to use when aggregating predictions by ID. Either "mean" or "majority".

When type is gaussian, only the "mean" method is available.

**mean:** The average prediction (value or probability) is calculated per ID and evaluated. This method assumes that the target class/value is constant within the IDs.

**majority:** The most predicted class per ID is found and evaluated. In case of a tie, the winning classes share the probability (e.g. P = 0.5 each when two majority classes). This method assumes that the target class/value is constant within the IDs.

models

Unnamed list of fitted model(s) for calculating R^2 metrics and information criterion metrics. May only work for some types of models.

When only passing one model, remember to pass it in a list (e.g. list(m)).

N.B. When data is grouped, provide one model per group in the same order as the groups.

N.B. When aggregating by ID (i.e. when id\_col is not NULL), it's not currently possible to pass model objects, as these would not be aggregated by the IDs.

N.B. Currently, Gaussian only.

apply\_softmax

Whether to apply the softmax function to the prediction columns when type is "multinomial".

N.B. Multinomial models only.

cutoff

Threshold for predicted classes. (Numeric)

N.B. Binomial models only.

positive

Level from dependent variable to predict. Either as character or level index (1 or 2 - alphabetically).

E.g. if we have the levels "cat" and "dog" and we want "dog" to be the positive class, we can either provide "dog" or 2, as alphabetically, "dog" comes after "cat".

Used when calculating confusion matrix metrics and creating ROC curves.

N.B. Only affects the evaluation metrics.

N.B. Binomial models only.

metrics

List for enabling/disabling metrics.

E.g. list("RMSE" = FALSE) would remove RMSE from the results, and list("Accuracy" = TRUE) would add the regular accuracy metric to the classification results. Default values (TRUE/FALSE) will be used for the remaining metrics available.

Also accepts the string "all".

N.B. Currently, disabled metrics are still computed.

include\_predictions

Whether to include the predictions in the output as a nested tibble. (Logical)

parallel Whether to run evaluations in parallel, when data is grouped with group\_by.

#### **Details**

Packages used:

Gaussian:

 $r2m: \texttt{MuMIn::r.squaredGLMM} \\ r2c: \texttt{MuMIn::r.squaredGLMM} \\$ 

AIC: stats::AIC
AICc: MuMIn::AICc

BIC: stats::BIC

#### Binomial and Multinomial:

Confusion matrix and related metrics: caret::confusionMatrix

ROC and related metrics: pROC::roc

MCC: mltools::mcc

#### Value

#### **Gaussian Results:**

Tibble containing the following metrics by default:

Average RMSE, MAE, r2m, r2c, AIC, AICc, and BIC.

N.B. Some of the metrics will only be returned if model objects were passed, and will be NA if they could not be extracted from the passed model objects.

Also includes:

A nested tibble with the **Predictions** and targets.

A nested tibble with the model **Coefficients**. The coefficients are extracted from the model object with broom::tidy() or coef() (with some restrictions on the output). If these attempts fail, a default coefficients tibble filled with NAs is returned.

#### **Binomial Results:**

Tibble with the following evaluation metrics, based on a confusion matrix and a ROC curve fitted to the predictions:

ROC:

AUC, Lower CI, and Upper CI

Confusion Matrix:

Balanced Accuracy, F1, Sensitivity, Specificity, Positive Prediction Value, Negative Prediction Value, Kappa, Detection Rate, Detection Prevalence, Prevalence, and MCC (Matthews correlation coefficient).

Other available metrics (disabled by default, see metrics): Accuracy.

Also includes:

A nested tibble with the **predictions** and targets.

A nested tibble with the sensativities and specificities from the **ROC** curve.

A nested tibble with the **confusion matrix**. The Pos\_ columns tells you whether a row is a True Positive (TP), True Negative (TN), False Positive (FP), or False Negative (FN), depending on which level is the "positive" class. I.e. the level you wish to predict.

## **Multinomial Results:**

For each class, a *one-vs-all* binomial evaluation is performed. This creates a **Class Level Results** tibble containing the same metrics as the binomial results described above, along with the **Support** metric, which is simply a count of the class in the target column. These metrics are used

to calculate the macro metrics in the output tibble. The nested class level results tibble is also included in the output tibble, and would usually be reported along with the macro and overall metrics.

The output tibble contains the macro and overall metrics. The metrics that share their name with the metrics in the nested class level results tibble are averages of those metrics (note: does not remove NAs before averaging). In addition to these, it also includes the **Overall Accuracy** metric.

Other available metrics (disabled by default, see metrics): Accuracy, Weighted Balanced Accuracy, Weighted Accuracy, Weighted F1, Weighted Sensitivity, Weighted Sensitivity, Weighted Pos Pred Value, Weighted Neg Pred Value, Weighted AUC, Weighted Lower CI, Weighted Upper CI, Weighted Kappa, Weighted MCC, Weighted Detection Rate, Weighted Detection Prevalence, and Weighted Prevalence.

Note that the "Weighted" metrics are weighted averages, weighted by the Support.

Also includes:

A nested tibble with the **Predictions** and targets.

A nested tibble with the multiclass Confusion Matrix.

#### Class Level Results

Besides the binomial evaluation metrics and the Support metric, the nested class level results tibble also contains:

A nested tibble with the sensativities and specificities from the **ROC** curve.

A nested tibble with the **Confusion Matrix** from the one-vs-all evaluation. The Pos\_ columns tells you whether a row is a True Positive (TP), True Negative (TN), False Positive (FP), or False Negative (FN), depending on which level is the "positive" class. In our case, 1 is the current class and 0 represents all the other classes together.

```

multiclass\_probability\_tibble

Generate a multiclass probability tibble

#### **Description**

## **Maturing**

Generate a tibble with random numbers containing one column per specified class. When the softmax function is applied, the numbers become probabilities that sum to 1 rowwise.

## Usage

```
multiclass_probability_tibble(num_classes, num_observations,
  apply_softmax = TRUE, FUN = runif, class_name = "class_")
```

participant.scores 29

## **Arguments**

num\_classes The number of classes. Also the number of columns in the tibble.

num\_observations
The number of observations. Also the number of rows in the tibble.

apply\_softmax Whether to apply the softmax function rowwise. This will transform the numbers to probabilities that sum to 1 rowwise.

Function for generating random numbers. The first argument must be the num-

ber of random numbers to generate, as no other arguments are supplied.

class\_name The prefix for the column names. The column index is appended.

#### Author(s)

**FUN** 

Ludvig Renbo Olsen, <r-pkgs@ludvigolsen.dk>

## **Examples**

```
# Attach cvms
library(cvms)
# Create a tibble with 5 classes and 10 observations
# Apply softmax to make sure the probabilities sum to 1
multiclass_probability_tibble(num_classes = 5,
                              num_observations = 10,
                              apply_softmax = TRUE)
# Using the rnorm function to generate the random numbers
multiclass_probability_tibble(num_classes = 5,
                              num_observations = 10,
                              apply_softmax = TRUE,
                              FUN = rnorm)
# Creating a custom generator function that
# exponentiates the numbers to create more "certain" predictions
rcertain <- function(n){</pre>
    (runif(n, min = 1, max = 100)^1.4)/100
}
multiclass_probability_tibble(num_classes = 5,

```

 $\verb"participant.scores"$ 

Participant scores

## Description

Made-up experiment data with 10 participants and two diagnoses. Test scores for 3 sessions per participant, where participants improve their scores each session.

30 precomputed.formulas

#### **Format**

A data frame with 30 rows and 5 variables:

```
participant participant identifier, 10 levels
age age of the participant, in years
diagnosis diagnosis of the participant, either 1 or 0
score test score of the participant, on a 0-100 scale
session testing session identifier, 1 to 3
```

#### Author(s)

Ludvig Renbo Olsen, <r-pkgs@ludvigolsen.dk>

```
precomputed.formulas Precomputed formulas
```

#### **Description**

Fixed effect combinations for model formulas with/without two- and three-way interactions. Up to eight fixed effects in total with up to five fixed effects per formula.

#### **Format**

A data frame with 259.358 rows and 5 variables:

```
\boldsymbol{formula}_{-} combination of fixed effects, separated by "+" and "*"
```

max\_interaction\_size maximum interaction size in the formula, up to 3

**max\_effect\_frequency** maximum count of an effect in the formula, e.g. the 3 A's in "A  $\star$  B + A  $\star$  C + A  $\star$  D"

num\_effects number of unique effects included in the formula

min\_num\_fixed\_effects minimum number of fixed effects required to use the formula, i.e. the index in the alphabet of the last of the alphabetically ordered effects (letters) in the formula, so 4 for the formula: "A + B + D"

#### **Details**

Effects are represented by the first eight capital letters.

Used by combine\_predictors.

#### Author(s)

Ludvig Renbo Olsen, <r-pkgs@ludvigolsen.dk>

reconstruct\_formulas 31

## **Description**

#### Maturing

In the results tibble from cross\_validate and validate, the model formulas have been split into the columns Dependent, Fixed and Random. Quickly reconstruct the model formulas from these columns.

## Usage

```
reconstruct_formulas(results, topn = NULL)
```

## **Arguments**

results Data frame with results from cross\_validate() or validate(). (tbl)

Must contain at least the columns "Dependent" and "Fixed". For random effects

the "Random" column should be included.

topn Number of top rows to return. Simply applies head() to the results tibble.

#### Value

List of model formulas.

## Author(s)

Ludvig Renbo Olsen, <r-pkgs@ludvigolsen.dk>

select\_metrics

Select columns with evaluation metrics and model definitions.

## Description

#### **Maturing**

When reporting results, we might not want all the nested tibbles and process information columns. This function selects the evaluation metrics and model formulas only.

### Usage

```
select_metrics(results, include_definitions = TRUE,
   additional_includes = NULL)
```

## Arguments

```
results Results tibble from cross_validate() or validate().
include_definitions
Whether to include the Dependent, Fixed and (possibly) Random columns. (Logical)
additional_includes
```

Names of additional columns to select. (Character)

#### **Details**

The first element in the Family column is used to identify the relevant columns.

#### Value

The results tibble with only metric and model definition columns.

#### Author(s)

Ludvig Renbo Olsen, <r-pkgs@ludvigolsen.dk>

validate

Validate regression models on a test set

## **Description**

#### Stable

Train gaussian or binomial models on a full training set and validate it by predicting the test/validation set. Returns results in a tibble for easy reporting, along with the trained models.

## Usage

```
validate(train_data, models, test_data = NULL,
  partitions_col = ".partitions", family = "gaussian", link = NULL,
  control = NULL, REML = FALSE, cutoff = 0.5, positive = 2,
  metrics = list(), err_nc = FALSE, rm_nc = FALSE,
  parallel = FALSE, model_verbose = FALSE)
```

## Arguments

```
train_data
                  Data Frame.
models
                  Model formulas as strings. (Character)
                  E.g. c("y~x", "y~z").
                  Can contain random effects.
                  E.g. c("y\sim x+(1|r)", "y\sim z+(1|r)").
test_data
                  Data Frame. If specifying partitions_col, this can be NULL.
partitions_col Name of grouping factor for identifying partitions. (Character)
                  Rows with the value 1 in partitions_col are used as training set and rows
                  with the value 2 are used as test set.
                  N.B. Only used if test_data is NULL.
family
                  Name of family. (Character)
                  Currently supports "gaussian" and "binomial".
link
                  Link function. (Character)
                  E.g. link = "log" with family = "gaussian" will use family = gaussian(link
                  = "log").
                  See stats::family for available link functions.
```

#### **Default link functions:**

Gaussian: 'identity'. Binomial: 'logit'.

control Construct control structures for mixed model fitting (i.e. lmer and glmer). See

lme4::lmerControl and lme4::glmerControl.

N.B. Ignored if fitting lm or glm models.

REML Restricted Maximum Likelihood. (Logical) cutoff Threshold for predicted classes. (Numeric)

N.B. Binomial models only

positive Level from dependent variable to predict. Either as character or level index (1

or 2 - alphabetically).

E.g. if we have the levels "cat" and "dog" and we want "dog" to be the positive class, we can either provide "dog" or 2, as alphabetically, "dog" comes after

"cat".

Used when calculating confusion matrix metrics and creating ROC curves.

N.B. Only affects evaluation metrics, not the model training or returned predic-

tions.

N.B. Binomial models only.

metrics List for enabling/disabling metrics.

E.g. list("RMSE" = FALSE) would remove RMSE from the results, and list("Accuracy"

= TRUE) would add the regular accuracy metric to the classification results. Default values (TRUE/FALSE) will be used for the remaining metrics available.

Also accepts the string "all".

N.B. Currently, disabled metrics are still computed.

err\_nc Raise error if model does not converge. (Logical)

rm\_nc Remove non-converged models from output. (Logical)

parallel Whether to validate the list of models in parallel. (Logical)

Remember to register a parallel backend first. E.g. with doParallel::registerDoParallel.

model\_verbose Message name of used model function on each iteration. (Logical)

## **Details**

## Packages used:

## **Models:**

Gaussian: stats::lm, lme4::lmer
Binomial: stats::glm, lme4::glmer

Results: Gaussian:

r2m:MuMIn::r.squaredGLMM r2c:MuMIn::r.squaredGLMM

AIC: stats::AIC
AICc: MuMIn::AICc
BIC: stats::BIC

Binomial:

Confusion matrix: caret::confusionMatrix

ROC: pROC::roc
MCC: mltools::mcc

#### Value

List containing tbl (tibble) with results and the trained model object. The tibble contains:

#### **Shared across families:**

A nested tibble with **coefficients** of the models from all iterations.

Count of **convergence warnings**. Consider discarding models that did not converge on all iterations. Note: you might still see results, but these should be taken with a grain of salt!

Count of **other warnings**. These are warnings without keywords such as "convergence".

Count of **Singular Fit messages**. See ?lme4::isSingular for more information.

Nested tibble with the warnings and messages caught for each model.

Specified family.

Specified link function.

Name of **dependent** variable.

Names of fixed effects.

Names of random effects, if any.

#### **Gaussian Results:**

RMSE, MAE, r2m, r2c, AIC, AICc, and BIC.

A nested tibble with the **predictions** and targets.

## **Binomial Results:**

Based on predictions of the test set, a confusion matrix and ROC curve are used to get the following:

ROC:

AUC, Lower CI, and Upper CI

Confusion Matrix:

Balanced Accuracy, F1, Sensitivity, Specificity, Positive Prediction Value, Negative Prediction Value, Kappa, Detection Rate, Detection Prevalence, Prevalence, and MCC (Matthews correlation coefficient).

Other available metrics (disabled by default, see metrics): Accuracy.

Also includes:

A tibble with **predictions**, predicted classes (depends on cutoff), and the targets.

A tibble with the sensativities and specificities from the **ROC** curve.
